

**Claim**

Security device for bracelets including a telescoping sliding system and a closure (2,6a,6b) permitting the adjustment of the length of the bracelet to the size of the wrist, characterized by the following:

The telescopic system features two elongated elements (1) sliding along two slots (2) and one button (4) making it possible to stop these elements at the end of the path, and one sliding part (6a), including grooves (3) and ridges (7) for guiding and stopping at the notches (5) of the first elongated element (1). The closure is composed of one fixed piece (6a) one end of which is interdependent with the second of the elongated elements (1) and cooperating with the sliding piece (6a) to block the closure once the desired length is achieved by the sliding of the telescopic system.
